

# Allandale Veterinary Hospital

Allandale Veterinary Hospital is an AAHA Accredited Practice. What is AAHA? It stands for American Animal Hospital Association. What does that mean for you? Allandale has undergone stringent requirements to become one of less than 7% of Canadian accredited clinics.

AAHA developed the accreditation program to raise the level of care being provided to companion animals. AAHA, along with a group of veterinary experts, developed the AAHA Standards of Accreditation as benchmarks for excellence. They also developed the evaluation system where practices are regularly evaluated by a Practice Consultant to ensure they meet AAHA's standards.

At Allandale we specialize in:

- Wellness & Preventative Care
- Emergency and / or Extended Critical Care
- Extensive On Site Surgical Capabilities
- Dentistry
- On-Site Diagnostic Capabilities
- Reproductive Services
- Pharmacy
- Referral Service to a number of Veterinary Specialists
- Nutritional Support
- Boarding
- Canine Rehabilitation
- Veterinary Ophthalmologist
- End of Life Care

In addition, Allandale Veterinary Hospital also has services available for pocket pets and pot-bellied pigs, client education seminars and house call services (on a limited basis).

## Adult Canine with Dental Wellness Plan

Preventive Care Exams – a year is a very long time in the life of your dog. This makes regular physical exams extremely important. Senior pets (those in the last 25% of their predicted life span) should have a routine health care visit every 6 months. This is the time to discuss your dog's vaccination status, parasite control, dental health, nutrition, exercise, mobility and mental health.

Wellness Blood Profile – includes a complete blood count and chemistries. The complete blood count can help determine many things about your dog, including whether he or she is dehydrated, anemic or dealing with an infection. The chemistry profile measures a variety of chemicals and enzymes in the blood to provide information about the status of organ health and function, especially of the liver, kidneys and pancreas. The chemistry profile also shows the patient's blood sugar level and the quantities of important electrolytes in the blood.

Urinalysis – the urinalysis can provide information not only about the kidneys and bladder, but the liver, pancreas and other organs.

Heartworm Test – there are few, if any, early signs of disease when a dog is infected with heartworms, so detecting their presence with a heartworm test is important. Heartworm tests are recommended even in pets that are taking preventative as nothing is 100%.

Intestinal Parasite Exam – an examination of your dog's stool allows for the detection of intestinal parasites which may cause illness in your dog or be transmitted to human family members. Medications will be dispensed based on parasites found.

Yearly Vaccines – not all vaccines are needed every year. Your veterinarian will determine what vaccines your dog requires. Leptospirosis and Bordetella need to be administered yearly. Rabies and Distemper / Hepatitis / Parainfluenza / Parvovirus are administered every 3 years.

Dental – good dental care is essential not only to your pet's health, but also to their quality of life. Broken, rotting teeth and infected gums can make your pet miserable. 85% of dogs and cats over the

age of 4 have some form of dental disease. Regular veterinary dental examinations and cleanings are recommended to decrease the progression of disease. It is important that dental cleanings are under anesthetic as cleaning only the top of the tooth, as occurs with "awake" dentals, can lead to even more problems in the long run. A professional cleaning and assessment includes IV fluids, anesthesia, a thorough inspection of the mouth and teeth, cleaning of the teeth and polishing.

Dental Radiographs – intra-oral radiographs of your pet's teeth assist with assessing which teeth are diseased. Radiographs help detect disease such as root abscesses, root resorption, bone loss and cysts which may not be readily visible on the surface. Radiographs assist in determining which teeth can be saved and which need to be extracted. Full mouth dental radiographs are used to assess all teeth.

SDMA - Over their lifetime, 1 in 3 cats and 1 in 10 dogs could develop chronic kidney disease (CKD)—a leading cause of death, particularly in cats. The IDEXX SDMA test is a revolutionary new kidney function test that will enable us to diagnose CKD in cats and dogs months or even years earlier than traditional methods, making it possible to intervene earlier and more effectively manage kidney disease.
